What Are Electromagnetic Fields?

Electromagnetic fields (EMFs) are regions of space where electric and magnetic forces are exerted by charged particles. These fields are fundamental to the behavior of electromagnetic radiation and are characterized by their electric field (E) and magnetic field (B). - Electric Field (E): A force field surrounding electric charges, influencing other charges within the field. - Magnetic Field (B): A force field generated by moving electric charges (currents) or magnetic materials. Electromagnetic fields are pervasive in nature and technology, from the Earth's magnetic field to the electromagnetic waves used in communication and radar systems.

Electromagnetic Waves: The Propagation of Energy

Electromagnetic waves are oscillations of electric and magnetic fields propagating through space at the speed of light. They can travel through vacuum and various media, carrying energy over vast distances. Key characteristics of electromagnetic waves include: - Wavelength (λ): Distance between successive peaks. - Frequency (f): Number of wave cycles per second. - Speed (c): In a vacuum, approximately 299,792 km/s. - Amplitude: Related to the wave's energy. Common examples include radio waves, microwaves, infrared, visible light, ultraviolet, X-rays, and gamma rays.
