What Is the phet natural selection simulation?

The phet natural selection simulation is an interactive digital model that allows users to simulate the process of natural selection in a virtual environment. It demonstrates how populations of organisms evolve over time due to environmental pressures, genetic variation, and reproductive success. Through this simulation, users can manipulate variables such as mutation rates, predator presence, and environmental conditions to observe their effects on populations. The primary goal of the simulation is to illustrate the mechanisms of evolution by natural selection — how specific traits become more common in a population over generations, leading to adaptation and sometimes even speciation.

How Does the phet natural selection simulation Work?

Core Components of the Simulation

The simulation typically features the following key elements:

1. **Organisms and Traits:** Visual representations of organisms with varying traits, such as color, size, or speed.
2. **Environment:** A habitat where organisms live and interact, which can be modified to include predators, food sources, and environmental hazards.
3. **Variables:** Adjustable parameters such as mutation rate, reproduction rate, and environmental factors.
4. **Time Progression:** A control to advance the simulation through generations, showing how populations change over time.

Simulation Process

The simulation progresses through iterative steps:

1. **Initial Population:** Users start with a population of organisms with diverse traits.
2. **Environmental Interaction:** External factors, like predators or limited resources, influence survival chances.
3. **Selection Pressure:** Traits that confer advantages increase the likelihood of survival and reproduction.
4. **Reproduction and Mutation:** Surviving organisms reproduce, passing on traits, with potential mutations introducing new variations.
5. **Next Generation:** The cycle repeats, revealing how the distribution of traits shifts over generations.

By adjusting variables, users can observe how different scenarios influence the speed and direction of evolution.
