Questions & Answers About cellular and molecular immunology abbas 7th

edition

No	Question	Answer
1	What are the key differences between innate and adaptive immunity discussed in Abbas's Cellular and Molecular Immunology 7th edition?	Innate immunity provides immediate, non-specific defense mechanisms such as macrophages, neutrophils, and natural killer cells, while adaptive immunity involves specific responses mediated by lymphocytes (B and T cells), characterized by memory and the ability to recognize specific antigens, as detailed in Abbas's textbook.
2	How does the complement system contribute to immune defense according to Abbas 7th edition?	The complement system enhances immune responses by promoting opsonization, cell lysis through membrane attack complexes, and inflammation. Abbas explains how its activation pathways (classical, lectin, and alternative) work together to protect against pathogens.
3	What are the molecular mechanisms underlying T cell activation described in Abbas's immunology book?	T cell activation involves T cell receptor recognition of peptide-MHC complexes, along with co-stimulatory signals (such as CD28 binding to B7). This triggers signaling cascades leading to T cell proliferation, differentiation, and effector functions, as explained in detail in Abbas's text.
4	How does class switching occur in B cells, and what is its significance, based on Abbas 7th edition?	Class switching in B cells is mediated by cytokine signals and activation-induced cytidine deaminase (AID), allowing B cells to produce different antibody isotypes (e.g., IgG, IgA, IgE) without changing antigen specificity. This process enhances immune defense tailored to different pathogens or tissues.

5	What role do cytokines play in regulating immune responses according to Abbas's immunology textbook?	Cytokines are signaling proteins that modulate immune cell development, differentiation, and effector functions. Abbas details how cytokines like IL-2, IL-4, IFN- γ , and TNF orchestrate immune responses, promoting inflammation, antibody production, or cytotoxic activity depending on the context.
6	What are the mechanisms of immune tolerance discussed in Abbas's 7th edition?	Immune tolerance involves central mechanisms (deletion or inactivation of self-reactive lymphocytes in the thymus and bone marrow) and peripheral mechanisms (anergy, suppression by regulatory T cells). Abbas emphasizes their importance in preventing autoimmunity.
7	How are memory T and B cells generated and maintained, according to Abbas's immunology resource?	Memory cells arise from activated lymphocytes that survive after an immune response, through processes involving differentiation and survival signals like IL-7 and IL-15. These cells persist long-term, enabling rapid and robust responses upon re-exposure to antigens.
8	What are the recent advances in immunotherapy highlighted in Abbas 7th edition?	Abbas discusses advances such as immune checkpoint inhibitors (e.g., anti-PD-1, anti-CTLA-4), CAR T-cell therapies, and monoclonal antibodies, which have revolutionized treatment for cancers and autoimmune diseases by modulating immune responses more precisely.
9	How does the molecular understanding of autoimmune diseases inform potential treatments, based on Abbas's immunology textbook?	Understanding the molecular pathways involved in autoimmunity, such as autoreactive T cells, cytokine dysregulation, and defective tolerance mechanisms, guides the development of targeted therapies like cytokine inhibitors, immune modulators, and tolerance-inducing strategies.
