Questions & Answers About the

immune system biointeractive

N o	Question	Answer
1	What is the primary function of the immune system in the human body?	The primary function of the immune system is to protect the body from harmful pathogens such as bacteria, viruses, fungi, and parasites, while also recognizing and eliminating abnormal cells like cancer cells.
2	How do vaccines help in strengthening the immune system?	Vaccines stimulate the immune system to recognize and remember specific pathogens by introducing harmless components or weakened forms of the pathogen, thereby enabling the body to mount a faster and more effective response upon actual exposure.
3	What role do white blood cells play in immune defense?	White blood cells, or leukocytes, are crucial components of the immune system that identify, attack, and destroy pathogens and infected cells, as well as coordinate immune responses through signaling molecules like cytokines.
4	How does the immune system distinguish between self and non-self?	The immune system uses specialized receptors on immune cells to recognize molecules called antigens; it learns to differentiate between the body's own cells (self) and foreign invaders (non-self) to target only harmful entities and prevent autoimmune reactions.
5	What are common factors that can weaken the immune system?	Factors such as stress, poor nutrition, lack of sleep, chronic illnesses, certain medications (like immunosuppressants), and aging can weaken the immune response, making the body more susceptible to infections.
