Introduction to Mouse and Rat Anatomy

The mouse (*Mus musculus*) and the rat (*Rattus norvegicus*) are members of the order Rodentia, family Muridae. Despite sharing a common ancestor and many morphological traits, their divergence dates back approximately 20-25 million years. These differences are reflected in their size, skeletal structure, organ systems, and behavioral adaptations, which are crucial considerations in experimental design and comparative physiology.

Skeletal System

Overall Size and Skeleton Composition

- **Size Differences:** - Mice typically measure about 6-9 cm in body length with a tail length of 5-10 cm and weigh approximately 20-40 grams. - Rats are larger, with body lengths of 20-25 cm, tail lengths similar or slightly longer, and weights ranging from 250-500 grams. - **Skeleton Density:** - Both species have delicate, lightweight bones suited for agility but rats have proportionally thicker and more robust bones, especially in limb bones, due to their larger size.
