|----|--------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  | What are the key differences between supervised and unsupervised learning in data science? | Supervised learning involves training a model on labeled data to predict outcomes, focusing on tasks like classification and regression. Unsupervised learning works with unlabeled data to identify hidden patterns or groupings, such as clustering and dimensionality reduction. |

|   |                                                                      |                                                                                                                                                                                                                                                                                                           |
|---|----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | How do you handle missing data in a dataset?                         | Missing data can be handled by techniques such as imputation (mean, median, mode), removing rows or columns with missing values, or using algorithms that support missing values. The choice depends on the data and the context of the problem.                                                          |
| 3 | Explain the concept of overfitting and how to prevent it.            | Overfitting occurs when a model learns noise in the training data, performing poorly on unseen data. Prevention methods include cross-validation, pruning, regularization (L1, L2), simplifying the model, and using techniques like dropout in neural networks.                                          |
| 4 | What is feature engineering and why is it important?                 | Feature engineering involves creating, transforming, or selecting variables to improve model performance. It is crucial because well-engineered features can make complex patterns more accessible to models, leading to better accuracy and generalization.                                              |
| 5 | Can you explain the bias-variance tradeoff?                          | The bias-variance tradeoff describes the balance between a model's ability to fit the training data (bias) and its ability to generalize to new data (variance). High bias can cause underfitting, while high variance can lead to overfitting. The goal is to find a balance that minimizes total error. |
| 6 | What are some common evaluation metrics for classification problems? | Common metrics include accuracy, precision, recall, F1-score, ROC-AUC, and confusion matrix. The choice depends on the problem's context, especially when dealing with imbalanced datasets where metrics like precision and recall are more informative.                                                  |
| 7 | Describe the process of hyperparameter tuning.                       | Hyperparameter tuning involves selecting the best parameters for a model to optimize performance. Techniques include grid search, random search, Bayesian optimization, and using cross-validation to evaluate different parameter combinations systematically.                                           |
| 8 | What is the purpose of cross-validation in model evaluation?         | Cross-validation assesses a model's ability to generalize to unseen data by partitioning the dataset into training and validation sets multiple times. It helps detect overfitting and ensures the model's robustness before deployment.                                                                  |
| 9 | How do you handle imbalanced datasets in classification tasks?       | Handling imbalanced datasets can involve techniques like oversampling the minority class (SMOTE), undersampling the majority class, using different evaluation metrics (like F1-score, ROC-AUC), and applying cost-sensitive learning to give higher penalty to misclassification of minority class.      |
