Earth's systems are traditionally classified into four main components:

1. Atmosphere: The layer of gases surrounding Earth, responsible for weather and climate regulation.
2. Biosphere: All living organisms, including plants, animals, and microorganisms.
3. Geosphere: The solid Earth, including rocks, minerals, landforms, and the Earth's crust.
4. Hydrosphere: All water on Earth, including oceans, lakes, rivers, ice, and groundwater.

Interactions among these systems:

These components are interconnected through complex processes:

1. The atmosphere influences the biosphere by providing air and climate conditions.
2. The biosphere affects the atmosphere via processes like photosynthesis (removing CO₂) and respiration (releasing CO₂).
3. The geosphere interacts with the atmosphere through volcanic eruptions releasing greenhouse gases.
4. The hydrosphere regulates climate through ocean currents and absorbing CO₂.
5. Changes in one system often ripple through others—for example, deforestation (biosphere) impacts atmospheric CO₂ levels and climate.

1. How does human activity contribute to climate change?

Answer:

Human activities significantly accelerate climate change through increased emissions of greenhouse gases (GHGs), primarily:
